Abstract

3

4 In a window wiper, in particular flat beam window wiper for vehicles, having a
5 spring strip back (10) with a variable strip thickness along the length of the back,
6 having a connecting device (11) situated in the middle on the spring strip back
7 (10) for a wiper arm (12), and having a rubber-elastic wiper strip (13) fastened to
8 the spring strip back (10), the spring strip back (10) is refined in such a way that it
9 exhibits a quasi constant course of strength or hardness along the length of the
10 back in order to ensure a consistent and equally good curvature of the curved
11 spring strip back (10) in all sections of the spring strip back (10).
